Trend in OPD Attendant per capita

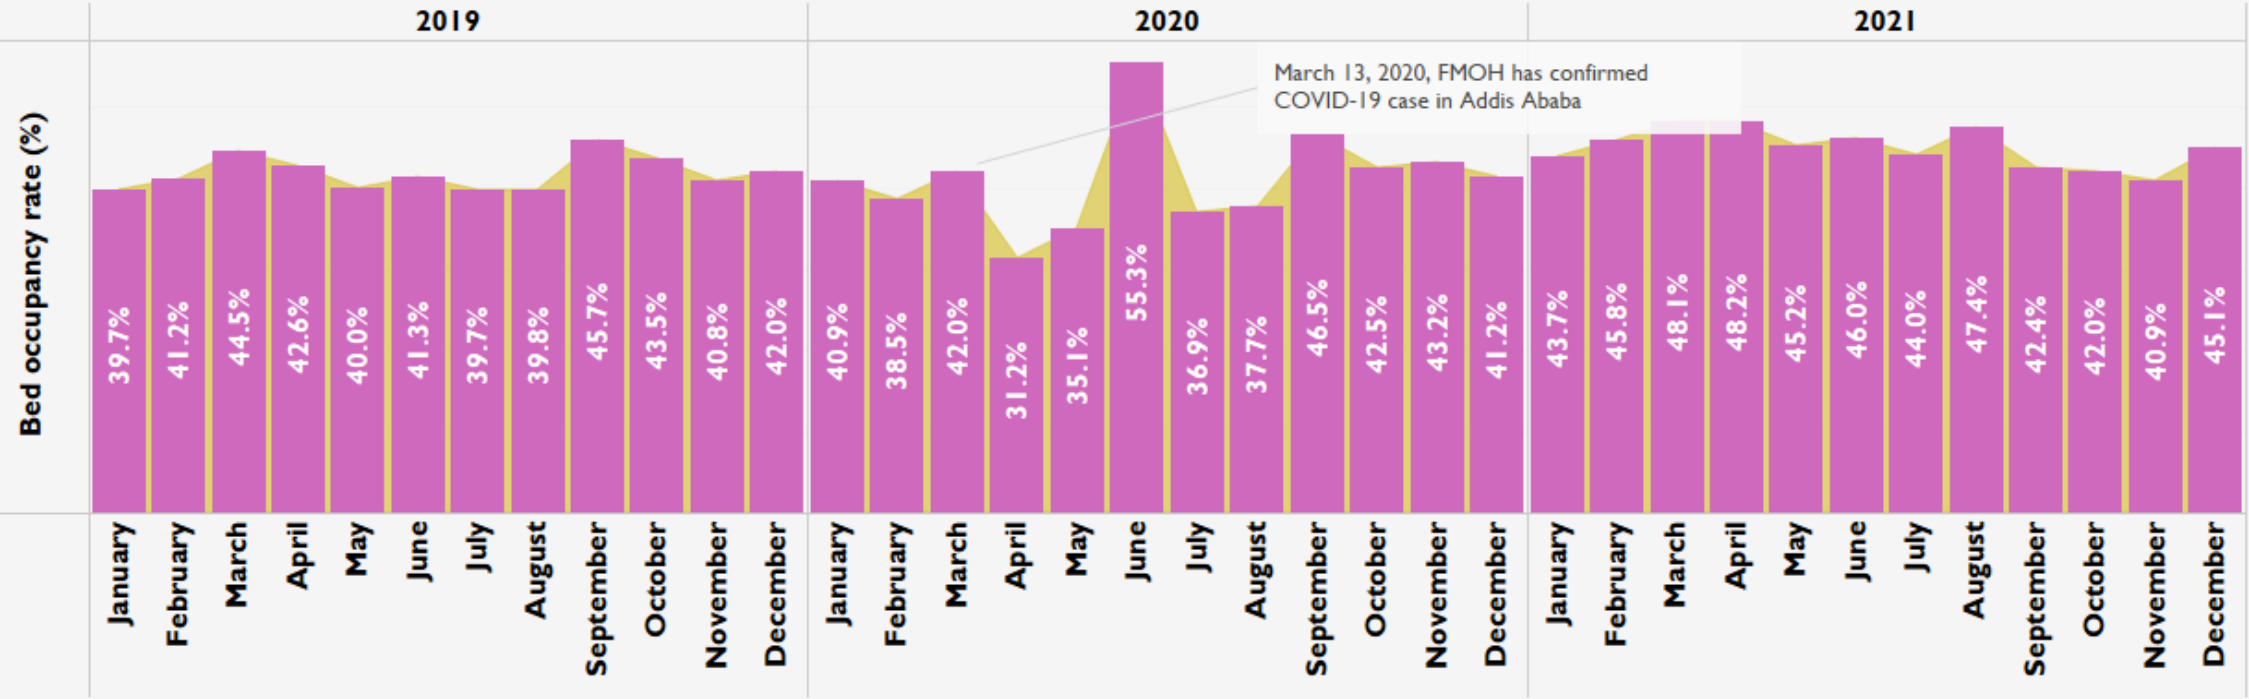

Total number of new and repeat outpatient attendances (including specialized clinics). Patients who attend the following services should be INCLUDED in the outpatient count: Health service utilization reflects the interaction between demand and supply of outpatient care. The use of outpatient services is inversely related to certain barriers that may be physical (distance), economic (cost to patient), cultural (low awareness and health care seeking behavior) or technical (poor quality of health care).

Trend in Admission rate

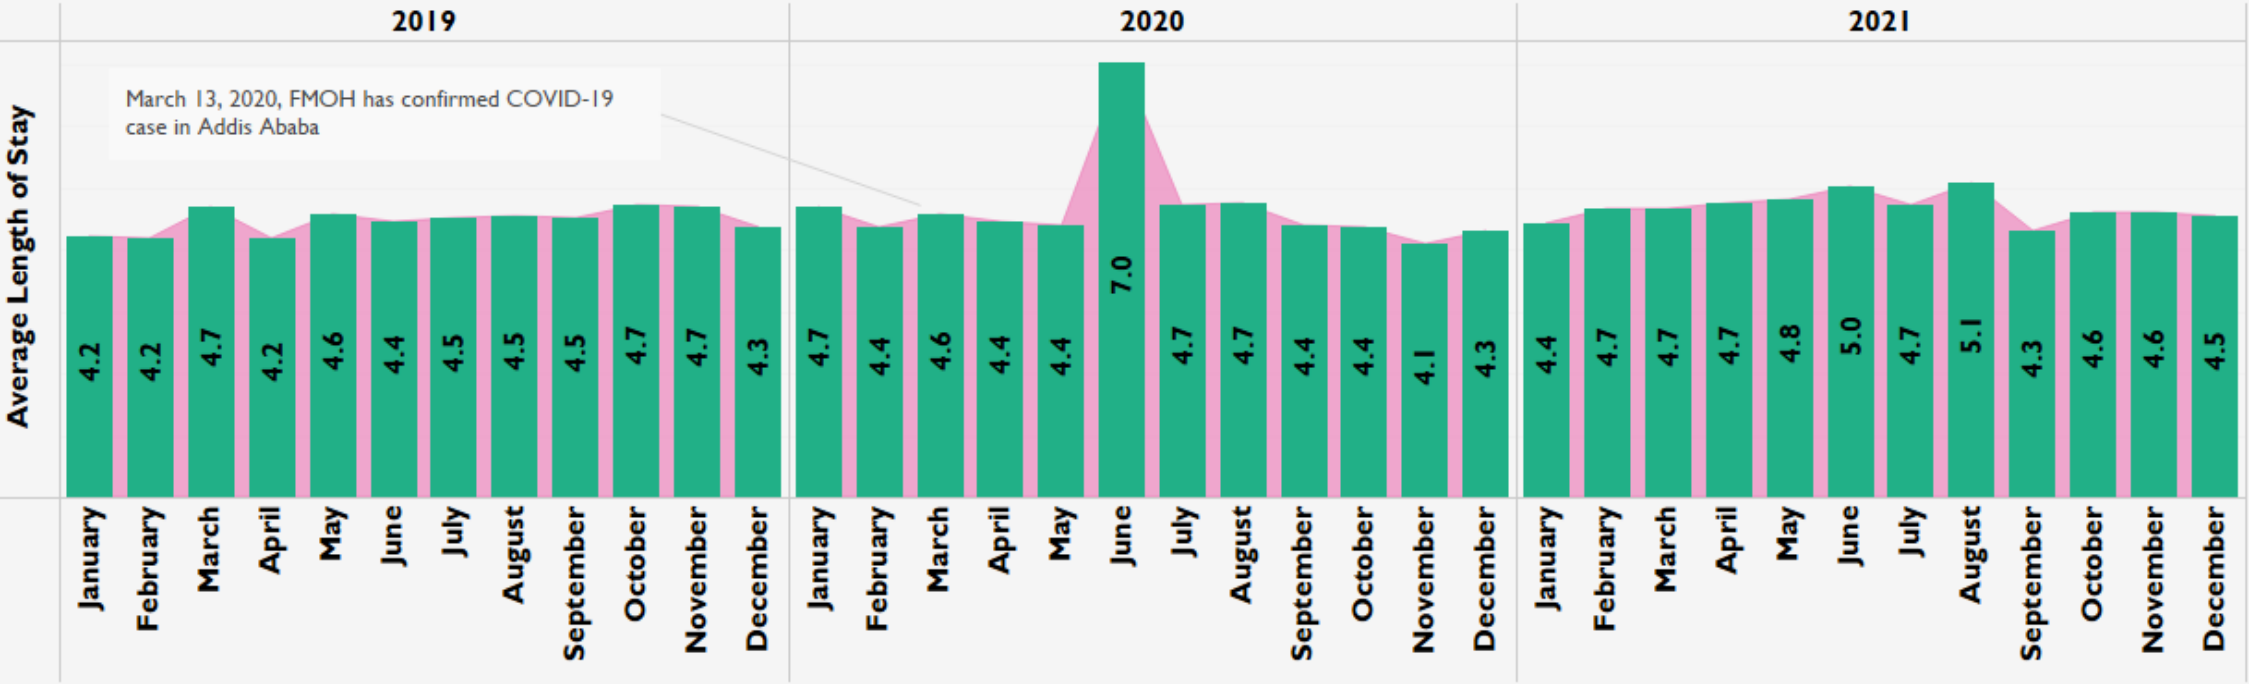

The number of patients admitted (including those transferred from another health facility) during the reporting period per 1,000 population. It includes all patients admitted.

Trend in Bed occupancy rate

Bed Occupancy Rate (BOR) reflects the level of utilization of inpatient services. Inpatient services incur a high overhead. In Ethiopia hospitals consume more than 40% of public sector health funds. Inpatient capacity that is greater than demand wastes resources. A low BOR requires investigation. A low BOR may also reflect low quality of service.

Trend in Average Length of Stay

Average Length of Stay (ALOS) reflects the appropriate utilization of inpatient services. By monitoring length of stay, hospitals can assess if patients remain in hospital for longer than is necessary, perhaps due to non-clinical reasons, and investigate further if required.
